

FOREWORD

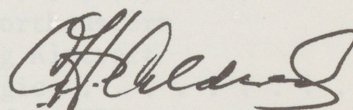

The technical program of the Symposium concentrated on the application of photo interpretation and remote sensing to resource inventories and environmental studies. The Working Groups and Project Teams of Commission VII were the foci for exchanges on these and related topics.

The papers in the Proceedings are grouped under the following topics: Land Use, Resource Inventories, Water and Wetlands, Environmental Monitoring, Vegetation Damage, Special Applications, Geology, and Interpretation and Analysis.

The Proceedings include papers presented at the Symposium and those read by title only.

The papers were, with a few exceptions, reproduced as received from the authors without major editing and retyping. Papers and abstracts written in German and French were, in most cases, left unchanged. Abstracts that were not incorporated in the text were placed at the end of the paper to which it belonged. Accordingly, some lack of uniformity in type, format and style will be noted but, in such a rapidly moving field, it seemed important to delay publication as little as possible.

Commission VII would like to thank all those who have contributed manuscripts.

Secretary Commission VII

Copies of the Proceedings may be obtained for \$15 each from the Canadian Institute of Surveying, 512 Rochester Street, Ottawa, Ontario.
